**ABSTRACT**

Common operational picture (COP) map-based interfaces display operational information to support integration of emergency responders. Such interfaces integrate different subsystems and present the resulting information into an overview for enabling situation awareness. Literature shows that they are often developed from non-user-centric perspectives and are defined in technological terms that are not adequately capturing the users' needs. Therefore, the aim of this particular work in progress is to get insight into the features and the role of COP map-based interfaces currently being used in Norway to (1) examine their content, functionality, and design; and (2) to understand how such displays are incorporated into the service context. This study structures the knowledge on map displays that constitute part of the COP services. Using workshop and interviews with the developers and users of existing COP map services, we identify requirements for a common operational symbology and common operational functionality to improve such map services and make them interoperable.

**Keywords**

Common Operational Picture, Situational Awareness, Map-based Interface, Cartographic Design, Cartographic Symbolization.

**INTRODUCTION**

Complex emergency operations typically require collaboration within a single command as well as between multiple actors such as police, fire department, and health department. In the management of emergency operations, engaged actors need to display operational information such as position and status of own emergency units as well as position and status of resources administrated by other emergency responders (Chmielewski and Galka, 2009). Moreover, within specific actors, various tasks are assigned differently, to their command posts, operational leaders, as well as to their particular field teams (Björkbom et al., 2013). Additionally, various actors have different structures and are administrated differently; they also need to follow different symbol standards (Chmielewski and Galka, 2009). All those aspects influence the way, in which information needs to be provided visually by means of common operational picture (COP) map-based interfaces.

The main task of COP tools is to combine data from different subsystems and present the resulting information into an overview for enabling situation awareness of a variety of actors during emergency operations (Björkbom et al., 2013). In 2006, McNeese et al. concluded that COPs are typically developed from non-user-centric perspectives and are defined in technological terms that are not always in the best interests of users. They identified

ARTICLE

## A user-centric optimization of emergency map symbols to facilitate common operational picture

Q1 Tomasz Opach and Jan Ketil Rød

Q2 Department of Geography, Norwegian University of Science and Technology, Trondheim, Norway

### ABSTRACT

Common operational understanding among engaged emergency responders is facilitated through shared operational pictures during crisis situations. Sharing is typically achieved through interactive tools, either desktop or web-based, in which map displays play an essential role. That role can be further strengthened if (1) agreed emergency symbols that are used in map-based interactive tools are sufficient to encode multifaceted operational information visually; and (2) the symbols are legible and meaningful for the diverse users of those tools. The authors revisited official emergency map symbols in use in Norway and reconsidered them against current requirements. To this end, they first conducted several meetings with stakeholders to elicit adequate revision requirements. Next, the reconsideration included the extension of the symbol set, symbol modification, and grouping. After the reconsideration, emergency management officers and specialists were interviewed. The interviews confirmed the agreement with the symbol categorization, extension of the symbols, and their modifications. The interviewees also made numerous suggestions to be considered in a follow-up study. Moreover, two concepts – symbol standardization and symbol harmonization – were proposed.

### 1. Introduction

Interaction between agents involved in a crisis operation is facilitated by a common operational understanding (Björkbo et al., 2013). The creation of a common perception along with a comprehensive insight into a hazardous event needs adequate decision-support tools. Map-based interfaces used to build common operational pictures (COPs) can be used as decision-support. Map-based COPs employ emergency map symbols to encode operational information visually and thus support coordination and information exchange during interagency operations (Chmielewski & Galka, 2009).

Conceptually and technically, map-based COPs integrate different georeferenced datasets and present an overview of the information to enable situation awareness (Björkbo et al., 2013). However, the integration is difficult to achieve because emergency responders have different task-specific needs and habits regarding the use of map symbols (Kuveždić Divjak et al., 2020). These aspects along with a broad range of mapping scales make emergency map symbols difficult to design (Robinson et al., 2011). It also happens that emergency maps are used by third-party actors such as media or local administration that want to see what is going on.

As a result, secondary requirements appear, to have symbols legible also for non-specialists. Literature shows that emergency map symbols are often developed from non-user-centric perspectives and are defined in technological terms that do not adequately capture the users' needs (McNeese et al., 2006). Therefore, although much effort has already been made to design emergency map symbols (Akella, 2009; Kostelnick & Hoeniges, 2019; Marinova, 2018; Robinson et al., 2012, 2011), there is still a need for studies of symbols to be used as a common repository (Robinson et al., 2013).

This study is part of a project with an overarching goal to enhance information sharing for common situational understanding in interagency operations (Authors, 2019). The long-term ambition is to determine a set of concepts to be symbolized, to elaborate the details in symbol design, and ultimately to propose an operational map symbol package to be used in map-based COPs in Norway. As this ambition extends the scope of a single study, we narrow it down to a specific task. Therefore, the aim of this study is to revisit the emergency map symbols provided by the Norwegian Mapping Authority (NMA) to address current demands regarding information sharing for common operational understanding and thus, to enhance the symbols' role in

---------------------------	--------------------------------------	-------------------------------------	--	--------------------------------------	---	--	-----------------------------	----------------------------------	------------------------------------	---------------------

**Update (July 2012):** DHS S&T has been working with the Pennsylvania State University's GeoVISTA Center to promote standardization and sharing of map symbology throughout DHS components and the public safety community. The following two prototype capabilities have been developed out of this effort:

1. A distributed, collaborative web based process and toolset that allow users to:
  - Review their existing symbology
  - Identify missing, redundant, ambiguous symbols
  - Identify poor symbol labels and definitions
  - Develop logical symbol categories
2. A web-based Symbology service (Symbol Store) that allows users to:
  - Find relevant symbols using keyword search (The prototype Symbol Store will initially be populated with ANSI 415-2006 (FGDC HSWG), HSIP, FEMA, and DHS NPPD symbols)
  - Review available symbols along with metadata such as: symbol name and description; where they are used (what organizations); are they part of a standard; etc.
  - Preview symbols on different scale maps
  - Select and download symbols
  - Publish symbols and symbol libraries to the Symbol Store

The prototype Symbol Store is currently hosted by Penn State for evaluation at <http://symbolstore.org>. Based on initial feedback, the Symbol Store capability would be useful across a broad variety of users and communities.

**Notice:** To the extent that any information/material contained herein is a Government work, it is not subject to copyright protection, and may be published/disseminated without restriction(s).

**Symbol Availability** - The information contained herein is the work of the FGDC Homeland Security Working Group including Federal, State, and local agencies. The

## Incidents Symbology Reference

(Version 2.20, Released: September 14, 2005)

Incidents - Category of eight Themes and forty-two Features that symbolize a "cause of action" or "source of disaster."

Use this page to cross-reference the Incidents symbols with their definitions.

Changed or New symbols are marked by an asterisk (\*) and have a light yellow or green background, respectively.

### 1.1 Hendelser

30px		50px		1.1.1	Opprinnelsesmarkering - Origin marking
30px		50px		1.1.2	Opprinnelsesmarkering, stedbunden - Origin marking at fixed location
30px		50px		1.1.3	Hendelse - Event
30px		50px		1.1.4	Hendelse, stedbunden - Event at fixed location

## Beredskapssymboler

Her vises arkivet over harmoniserte kartsymboler for krisehåndtering utarbeidet av [INSITU](#) prosjektet. Arkivet inneholder 135 kartsymboler. Noen symboler er nye, men mange symboler er modifikasjoner eller lik dem som er tilgjengelig fra [Kartverkets beredskapssymboler](#). Arbeidet med harmoniseringen vil bli publisert i tidsskriftet [Cartography and Geographic Information Science](#).

### 1 Rapportering og kontekst

- 1.1 Hendelser
- 1.2 Risikoer
- 1.3 Naturkatastrofer
- 1.4 Vind
- 1.5 Sikt
- 2 Operasjoner
  - 2.1 Operasjonell informasjon
  - 2.2 Primær nødetat - Politi
  - 2.3 Primær nødetat - Brann
  - 2.4 Primær nødetat - Helse
  - 2.5 Sekundær nødetat - Sivilforsvar
  - 2.6 Sekundær nødetat - Militær
- 3 Infrastruktur
  - 3.1 Telekommunikasjon
  - 3.2 Tjenester
  - 3.3 Transport - Land
  - 3.4 Transport - Vann
  - 3.5 Transport - Luft
  - 3.6 Turisme og idrett
  - 3.7 Verneområder
